

Theatre AI App Summary (Repo Evidence)

What It Is

Theatre AI is a Vite + React single-page web app for protecting voice and likeness rights in the entertainment industry. It combines a marketing landing page, animated feature demos, and a research/blog reading experience.

Who It Is For

Primary persona: actors/talent and studio teams handling AI usage rights and licensing workflows. The hero copy explicitly references the Indian entertainment industry.

What It Does

- Presents rights/consent positioning with registration and demo calls-to-action (src/components/Hero.tsx).
- Shows a 3-step flow: Verify -> License -> Generate, including CastID and usage token concepts (src/components/Workflow.tsx).
- Runs an animated card scanner demo with moving cards, canvas light bar, and ASCII scan overlay (src/components/CardScanner.tsx).
- Displays four scanner capability callouts (identity, audit/compliance, licensing, usage tokens) (src/components/ScannerFeatures.tsx).
- Provides a research page with article cards and route links (src/pages/ResearchPage.tsx).
- Renders article detail pages via route param and hardcoded mock HTML content (src/pages/ArticlePage.tsx).

How It Works (Architecture)

- Client shell: React 18 app bootstrapped in src/main.tsx with BrowserRouter; App composes Navbar + routed pages + Footer.
- Routing: /, /new-hero, /portfolio-shader, /research, /research/:id, and wildcard redirect to /.
- Data flow: UI content is mostly local static arrays/objects in components/pages; no state store found in repo.
- External service: Hero dynamically injects UnicornStudio script from jsDelivr CDN at runtime.
- Backend/API/database/auth wiring: Not found in repo (package.json includes Supabase dependency, but no src usage found).

How To Run (Minimal)

- Prerequisite Node.js version: Not found in repo.
- Install dependencies: npm install
- Start local dev server: npm run dev
- Optional production check: npm run build && npm run preview
